Radial Approach to His Bundle Ablation for Fast Atrial Fibrillation in a Patient With an ICD-CRT Device

To the Editor,

Heart resynchronization therapy (HRT) improves heart function, quality of life and survival in patients with symptomatic heart failure, QRS ≥120 ms and left ventricular dysfunction. More and more studies have shown benefit in patients with atrial fibrillation (AF), as long as biventricular stimulation rates greater than 90% are achieved. If this target is not achieved by pharmacological treatment, atrioventricular node ablation is indicated.

We present the case of a 66-year-old man suffering from hypertension, diabetes and dyslipidemia, diagnosed with ischaemic dilated cardiomyopathy with a LVEF of 30%, surgically revascularized, with AF and functional class NYHA II-III, with frequent hospitalizations due to heart failure decompensation, which led to the decision to implant an automatic implantable defibrillator with heart resynchronization therapy (HRT).

Stimulation rates of less than 80% were registered, so it was decided to perform His branch ablation by the arterial route, to avoid displacing the left ventricle electrode by manipulating the ablation catheter near the coronary sinus. The patient suffered from severe Leriche syndrome (aortoiliac atherosclerotic disease), making it impossible to access the femoral artery during a previous coronary angiography attempt. Therefore, the procedure was performed by using the radial artery.

The puncture area was anæsthetized with 2% lidocaine, the radial artery was canalised 1-2 cm proximal to the styloid process of the radius by insertion of a 5 F (Terumo®, Radifocus® Introducer II) radial introducer. After, 2.5 mg of verapamil (antispasmodic drug) and 5000 U of sodium heparin were administered intraarterially. A (Medtronic® Mariner 5F, 4 mm tip) ablation catheter was introduced (Figure 1) retro-aortically until it was positioned over the left His bundle (Figure 2), and ablation was performed without any complications. Times of the procedure, ablation, scopy (30 min,
